Summary

Illinois and its counties have experienced a decline in mortality and a significant increase in life expectancy for both males and females from 1989 to 2019; therefore, assessing the part of the remaining years of life a person can expect to live without any functional disability is important for measuring quality of life. In this report, disability-free life expectancy (DFLE) is estimated for Illinois, its counties, and the city of Chicago, using the American Community Survey's (ACS) definition and data on disability, the U.S. Census Bureau's population data, and the Illinois Vital Records System's (IVRS) death data. Demographic-epidemiologic modeling (Sullivan 1971) was used for DFLE computation, and GIS mapping for assessing spatial contrast.

Results show significant differences in DFLE between males and females in all the counties, Chicago, and statewide, mostly in favor of females. At the state level, a baby girl may live 70.44 years of her 81.38 expected years of life without disability; whereas a baby boy may live 66.41 years without disability out of his 75.88 expected years of life, a difference of 4.03 years. At the county level, these differences vary from 8.1 years ($p < 0.001$) to 0.8 years. Mapping of DFLE as a percentage of remaining years of life at birth and at age 65, categorized by quartiles, shows significant contrast between northern and southern parts of the state, with most parts of the north falling in the first quartile and the south falling in the last quartile.

Public policy, health planning, and health intervention agencies may use these findings to make health programs services accessible for people with disabilities. This may prevent people with disabilities from developing chronic diseases that have the potential to decrease their quality of life.

Introduction

Like the U.S. population as a whole, the population of the state of Illinois has been experiencing some important improvements in health outcomes. Mortality has been decreasing along with a significant increase in life expectancy for both males and females. An increase in life expectancy has been observed in 94 of 102 counties (Shahidullah & Agbodo, 2014). With demographic and epidemiologic transition, people live longer and more people become members of the elderly population. More people die of chronic diseases than acute diseases (Molla 2013). As people live longer, they are naturally subject to chronic and degenerative diseases and eventually experience activity limitations. Knowing the portion of their lives free of activity limitations has become important to public health and aging practitioners in measuring quality of life.

Years of disability-free life expectancy (DFLE) is the indicator used to assess the portion of the remaining years of life a person can expect to live free of the consequences of activity limitations. Disability is a complex concept that can be defined variably considering health status, technology advancement, social structure, and cultural beliefs. The International Classification Functioning, Disability, and Health attempted to come up with a comprehensive definition by considering disability as an umbrella term for impairments, activity limitations, and participation restrictions (WHO 2001). To operationalize this definition, the U.S. Census Bureau (Brault 2012) considered disability in the communicative, mental, and physical domains. For the sake of this report, the American Community Survey's (ACS) definition of "disability" was adopted, which is functional limitations that include one or a combination of the following six health issues: hearing, vision, cognitive, ambulatory, self-care, and independent living difficulties (Table 1).

This report provides disability-free life expectancy at ages (in years) 0, 35, 65, and 75 for the state, its 102 counties, and the city of Chicago. The purpose of this report is to assess differences in active life between males and females and between counties and provide benchmark data for health improvement programs and long-term care planning.

Data and Method

The abridged life table technique (Shryock and Siegel 1976, Chiang 1984, Wei et al 2012, Silcocks 2001, and Toson 2003) was used to compute both life expectancy (LE) and expected years of disability-free life (DFLE). The data used include the 2018 population estimates for Illinois, Chicago, and Illinois counties; 2017 to 2019 Illinois Vital Records System (IVRS) death counts received from the Office of Policy, Planning, and Statistics (OPPS) Division of Vital Records; and the 2015 to 2019 American Community Survey (ACS) disability estimates. These data were obtained for Illinois, Illinois counties, and the city of Chicago; population and death data were aggregated into five-year age groups and by sex for abridged life tables computation, using Chiang's method. The DFLE was computed for ages 0, 35, 65, and 75 years, using Sullivan's (1971) and Molla's et al. methods (Molla et al., 2001). In the process, years of life with no disability were estimated by applying the proportion of people with no disability at each aforementioned age to the total years of life they contributed. These values were then used in the rest of the life table computation process to obtain DFLE (Table 2). A Z-test was used to evaluate the significance of differences found between males and females in years of disability-free life (YDFL). Also, GIS mapping techniques were used to assess spatial contrast within the state.

Results

Prevalence of Disability

Figure 1 presents percentages of the defined age groups' populations in the total population and the proportion (prevalence) of functionally disabled people in each defined age group. Disability prevalence increases with age, ranging from 3.37% in age group "less than 18 years" to 46.52% in age group "75 years and above."

Figure 1. Percent of Total Population and Percent of Population with Functional Disability by Age in Illinois: 2015-2019

Figure 2 shows the variability of the prevalence of functional disability by age group among the male population. The prevalence rate increases from 4.11% for the age group “less than 18 years” to 44.42% for the age group “75 years and above.”

Figure 2. Percent of Total Male Population and Percent of Male Population with Functional Disability by Age in Illinois: 2015-2019

Figure 3 shows the range of the prevalence of functional disability in Illinois across five age groups among the female population for the period of 2015-2019. The prevalence increases with age from 2.60% for the female population younger than 18 years to 47.92% for the older female population aged 75 years and above.

Figure 3. Percent of Total Female Population and Percent of Female Population with Functional Disability by Age in Illinois: 2015-2019

Like the rest of the state, the older population in Chicago has a higher proportion of functional disability than their younger counterparts. Figure 4 shows the range of functional disability prevalence in Chicago across different age groups during the period 2015-2019. The prevalence ranges from 2.90% for the population aged under 18 years to 48.67% for the population aged 75 years and above.

Figure 4. Percent of Total Population and Percent of Population with Functional Disability by Age in Chicago: 2015-2019

Figure 5 demonstrates how the prevalence of functional disability among Chicago males varies across different age groups during 2015-2019. It increases with age from 3.56% for males younger than 18 years of age to 44.44% among older males aged 75 years and above.

Figure 5. Percent of Total Male Population and Percent of Male Population with Functional Disability by Age in Chicago: 2015-2019

Figure 6 demonstrates how the prevalence of functional disability in Chicago females varies across different age groups for the period 2015-2019. It increases with age in females from 2.24% for below 18 years of age to 51.24% among older females aged 75 years and above.

Figure 6. Percent of Total Female Population and Percent of Female Population with Functional Disability by Age in Chicago: 2015-2019

Figure 7 compares the prevalence of functional disability of Illinois' population ages 65 years and older during 2015-2019. Prevalence of functional disability in all three groups (total population, males, and females) is almost equal where 32.82% of the total population ages 65+ have a disability, and 31.85% and 33.58% of the male and female population, respectively, aged 65+ have a disability.

Figure 7. Percent with Functional Disability among Population 65 Years and Over by Sex: 2015-2019

Figure 8 compares the prevalence of functional disability for population ages 65 and older in Chicago from 2015-2019. Functional disabilities for the three groups (total population, males, and females) 35.51% for total population, 32.70% for males 65+, and 37.52% for females 65+. Table 3 can be referenced for prevalence of disability by age and sex for all counties in Illinois for the period 2009 to 2013.

Figure 8. Percent with Functional Disability among Population 65 Years and Over by Sex in Chicago: 2015-2019

Figure 9 shows the prevalence of functional disability across three different race groups for the population 65 and older in Illinois. The prevalence rates of functional disability for White Alone, Black Alone, and All Other Races for 2015-2019 were 32.17percent, 39.10%, and 30.20%, respectively.

Figure 9. Percent of Population 65+ with Functional Disability by Race in Illinois: 2015-2019

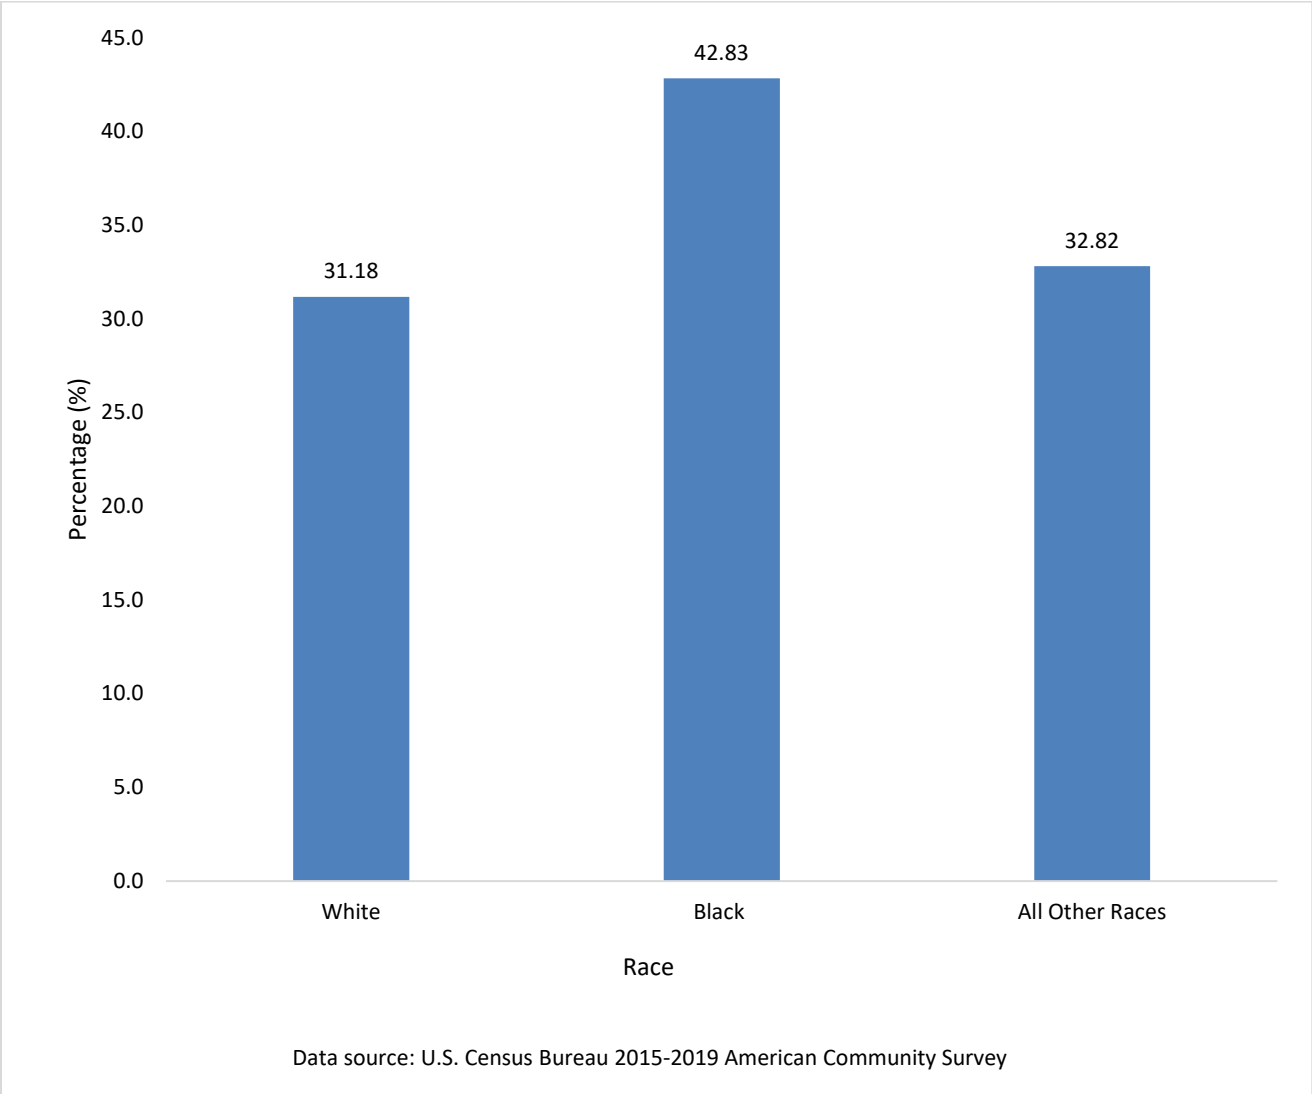

Figure 10 shows the prevalence of functional disability across three different race groups for the population 65 and over in Chicago. The prevalence of functional disability for White Alone, Black Alone, and All Other Races for 2015-2019 was 31.18%, 42.83%, and 32.82%, respectively. Table 4 presents the prevalence of functional disability by race or ethnicity for the counties in Illinois.

Figure 10. Percent of Population 65+ with Functional Disability by Race in Chicago: 2015-2019

Population by age and with functional disability were projected by multiplying prevalence rates from the 2015-2019 American Survey Community Survey (ACS) to the projected population by age and sex for 2015, 2020, 2025, and 2030. These projections were produced for Illinois, Chicago, and Illinois counties (Table 5).

Disability-Free Life Expectancy

The estimates of years of disability-free life (YDFL) expectancies show that a baby born in 2018 can expect to live an average of 78.63 (± 0.09) years, of which 68.41 (± 0.01) years, or 87.00%, may be free of functional disability. At age 35, the expectation of life averages 45.33 (± 0.07), with 36.34 (± 0.01) years, or 80.17%, are free of disability. For seniors at age 65, life expectancy is near 19.51 (± 0.06) years with YDFL accounting for 12.59 (± 0.01) years, or 64.53%. In the age category 75 or older, life expectancy falls to 12.54 (± 0.06) years, of which YDFL covers 6.71 (± 0.01) years and represents 53.51% (Table 6).

The analysis of these statistics by sex shows better outcomes for women compared to men. A baby girl may live 70.44 (± 0.02) years of her 81.38 (± 0.12) expected years of life with no disability; whereas a baby boy may live 66.41 (± 0.02) years with no disability out of 75.88 (± 0.13) expected years of life, a difference of 4.03 years ($p < 0.001$). At age 65, the gap reduced to only 1.39 years ($p < 0.001$); a woman at that age has a life expectancy of 20.79 (± 0.09) years of which 13.24 (± 0.02) years or 63.68% are free of disability and a man at the same age has a life expectancy of 18.03 (± 0.09) years with 11.85 (± 0.02) years or 65.72% free of disability (Table 6).

At the county level, the differences in YDFL expectancies between women and men at birth vary from 13.3 years to 1.0 year, in favor of females. This observation is made in all the counties (Table 6).

Figure 11 compares total life expectancy and disability-free life expectancy by age and for both genders in Illinois for 2017-2019. Total life expectancy and disability-free life expectancy gradually decrease as the age increases. With the age increase, life expectancy gradually decreases from 78.63 years to 45.33 years, to 19.51 years, and to 12.54 years (at ages 0, 35, 65, and 75, respectively). Similarly, the disability-free life expectancy gradually decreases for both sexes as the age increases from 68.41 years to 36.34 years, to 12.59 years, and to 6.71 years.

Figure 11. Total Life Expectancy and Disability-Free Life Expectancy at Birth by Age for Both Sexes in Illinois:2017-2019

Figure 12 compares total life expectancy and disability-free life expectancy by age for males in Illinois for 2017-2019. As the age increases, life expectancy for males gradually decreases from 75.88 years to 43.03 years, to 18.03 years, and to 11.47 years. Similarly, the disability-free life expectancy percent for males gradually decreases as the age increases from 66.41 years to 34.95 years, to 11.85 years, and to 6.37 years (for ages at 0, 35, 65, and 75, respectively).

Figure 12. Total Life Expectancy and Disability-Free Life Expectancy at Birth by Age for Males in Illinois: 2017-2019

Figure 13 compares total life expectancy and disability-free life expectancy by age for females in Illinois for 2017-2019. As the age increases, the life expectancy for females gradually decreases from 81.38 years to 47.56 years, to 20.79 years, and to 13.37 years (at ages 0, 35, 65, and 75, respectively). Similarly, the disability-free life expectancy for females gradually decreases as the age increases from 70.44 years to 37.70 years, to 13.24 years, and to 6.96 years for the same age groups.

Figure 13. Total Life Expectancy and Disability-Free Life Expectancy at Birth by Age for Females in Illinois: 2017-2019

In Figure 14, as age increases, life expectancy gradually decreases from 77.96 years to 44.86 years, to 20.39 years, and to 14.09 years (at ages 0, 35, 65, and 75, respectively). DFLE gradually decreases as the age increases from 67.28 years to 35.17 years, to 12.50 years, and to 7.23 years for the same age groups.

Figure 14. Total Life Expectancy and Disability-Free Life Expectancy at Birth by Age for Both Sexes in Chicago: 2017-2019

Figure 15 compares total life expectancy and disability-free life expectancy by age for males in Chicago for 2017-2019. Total life expectancy and disability-free life expectancy in males gradually decreases as age increases. As age increases, the life expectancy for males gradually decreases from 73.88 years to 41.34 years, to 17.89 years, and to 12.17 years (at ages 0, 35, 65, and 75, respectively). Similarly, the disability-free life expectancy for males gradually decreases as the age increases from 64.86 years to 33.41 years, to 11.59 years, and to 6.76 years for the same age groups.

Figure 15. Total Life Expectancy and Disability Free Life Expectancy at Birth by Age for Males in Chicago: 2017-2019

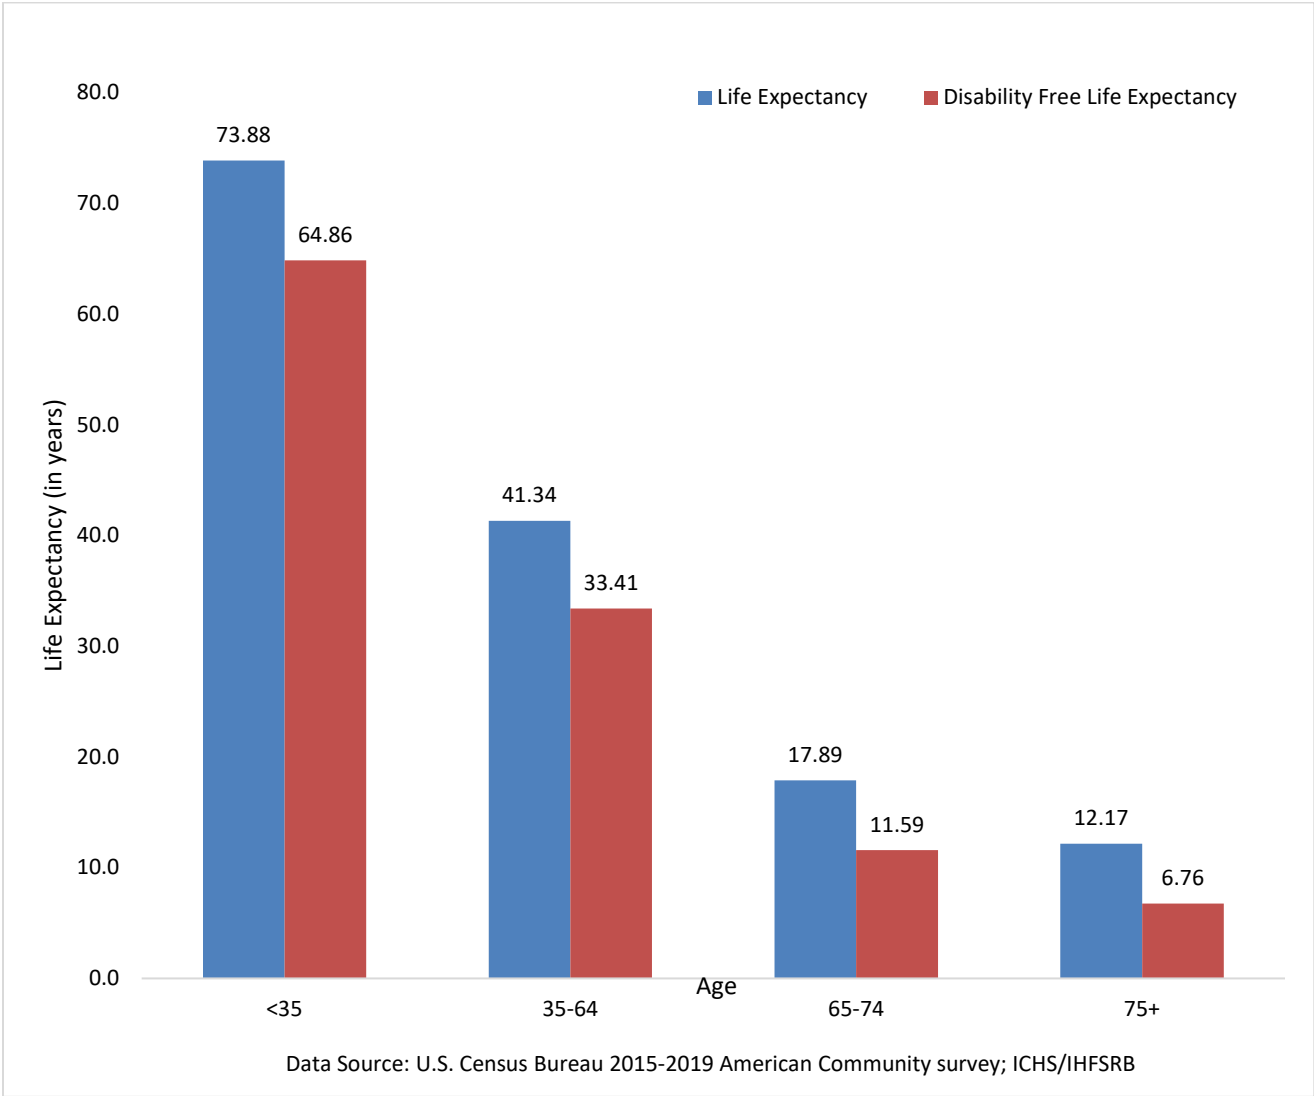

Figure 16 compares total life expectancy and disability-free life expectancy by age for females in Chicago for 2017-2019. Total life expectancy and disability-free life expectancy in females gradually decrease as age increases. As the age increases, the life expectancy for females gradually decreases from 82.00 years to 48.25 years, to 22.42 years, and to 15.44 years (at ages 0, 35, 65, and 75, respectively). Similarly, the disability-free life expectancy for females gradually decreases as the age increases from 69.69 years to 36.87 years, to 13.22 years, and to 7.53 years for the same age groups.

Figure 16. Total Life Expectancy and Disability-Free Life Expectancy at Birth by Age for Females in Chicago: 2017-2019

Figure 17 compares the DFLE as a percentage of life expectancy at birth and at age 65 years for both sexes in Illinois counties for 2017-2019. The map on the left side shows the DFLE as percentage of life expectancy at birth. The map on the right side shows the DFLE as a percentage of life expectancy at age 65 years. The percentages of DFLE at birth range from 62.50 to 87.40. The percentage of DFLE at age 65 years decreases and ranges from 40.90 to 71.70. The percentage of DFLE for both sexes decreases from birth to age 65 years.

Figure 17. Disability-Free Life Expectancy (DFLE) as Percentage of Life Expectancy at Birth and at Age 65 Years for Both Sexes in Illinois Counties: 2017-2019

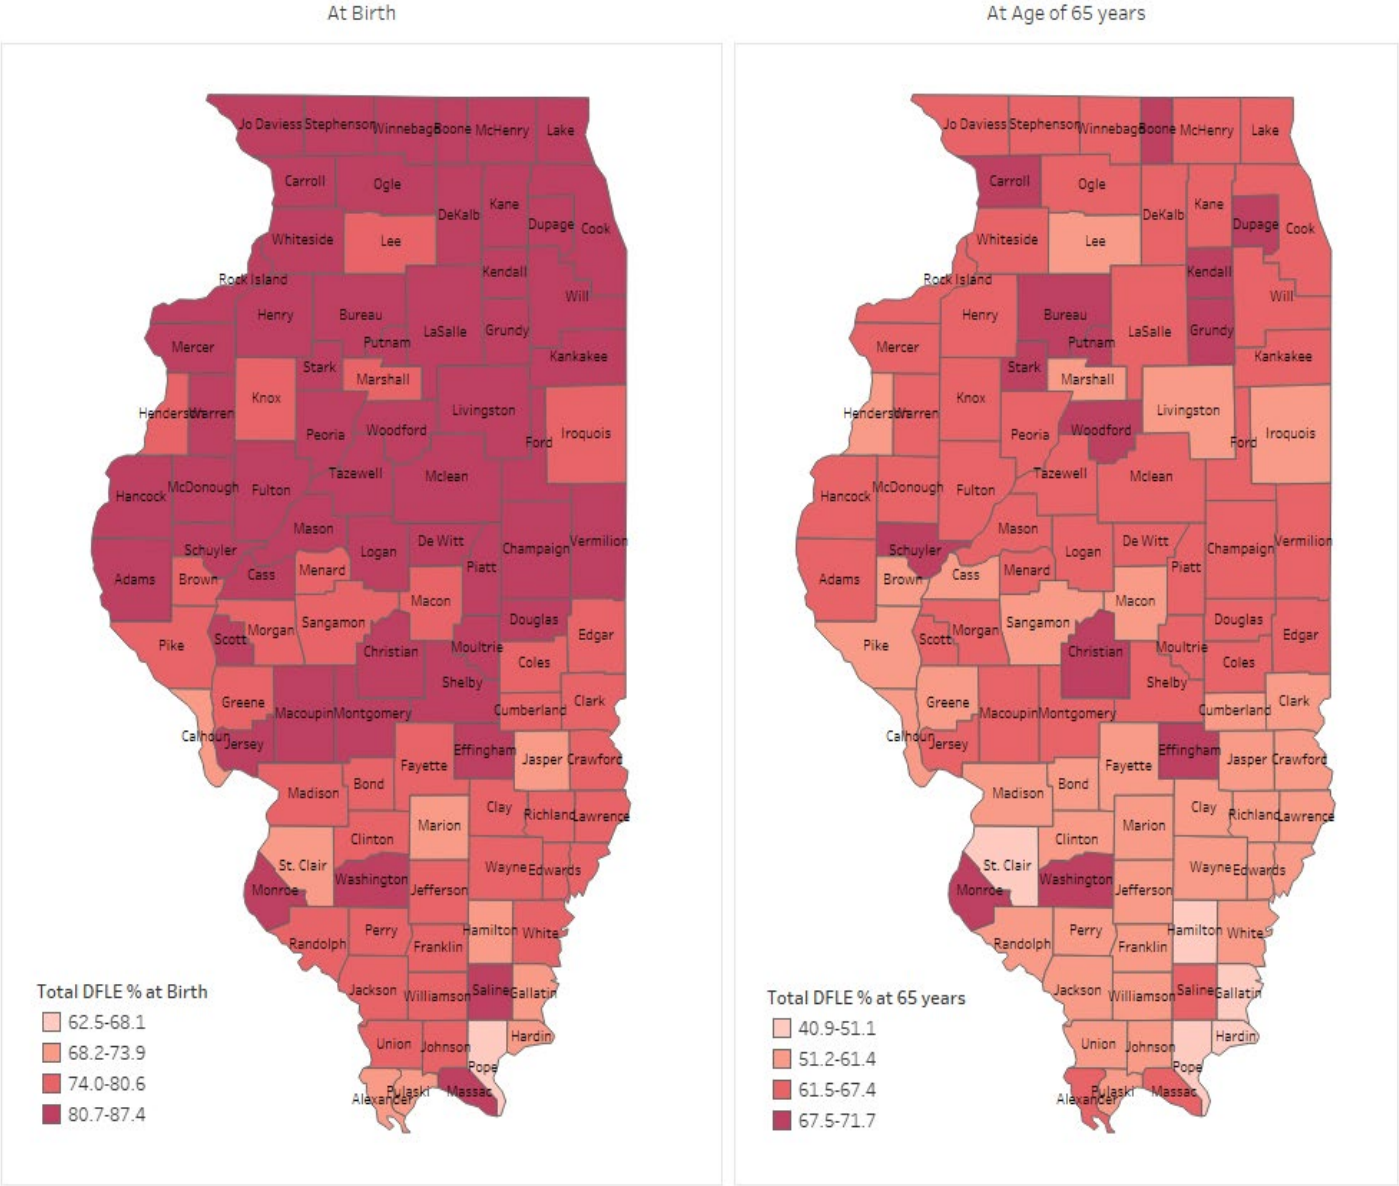

Figure 18 compares the DFLE as a percentage of life expectancy at birth and at age 65 years for males for Illinois counties for 2017-2019. The map on the left side shows the DFLE as a percentage of life expectancy for males at birth. The map on the right side shows the DFLE as a percentage life expectancy for males at age 65 years. Percentages of DFLE at birth range from 65.90 to 89.90 and the percentages of DFLE at age 65 years decrease and range from 41.60 to 74.90.

Figure 18. Disability-Free Life Expectancy (DFLE) as Percentage of Life Expectancy at Birth and at Age 65 Years for Males in Illinois Counties: 2017-2019

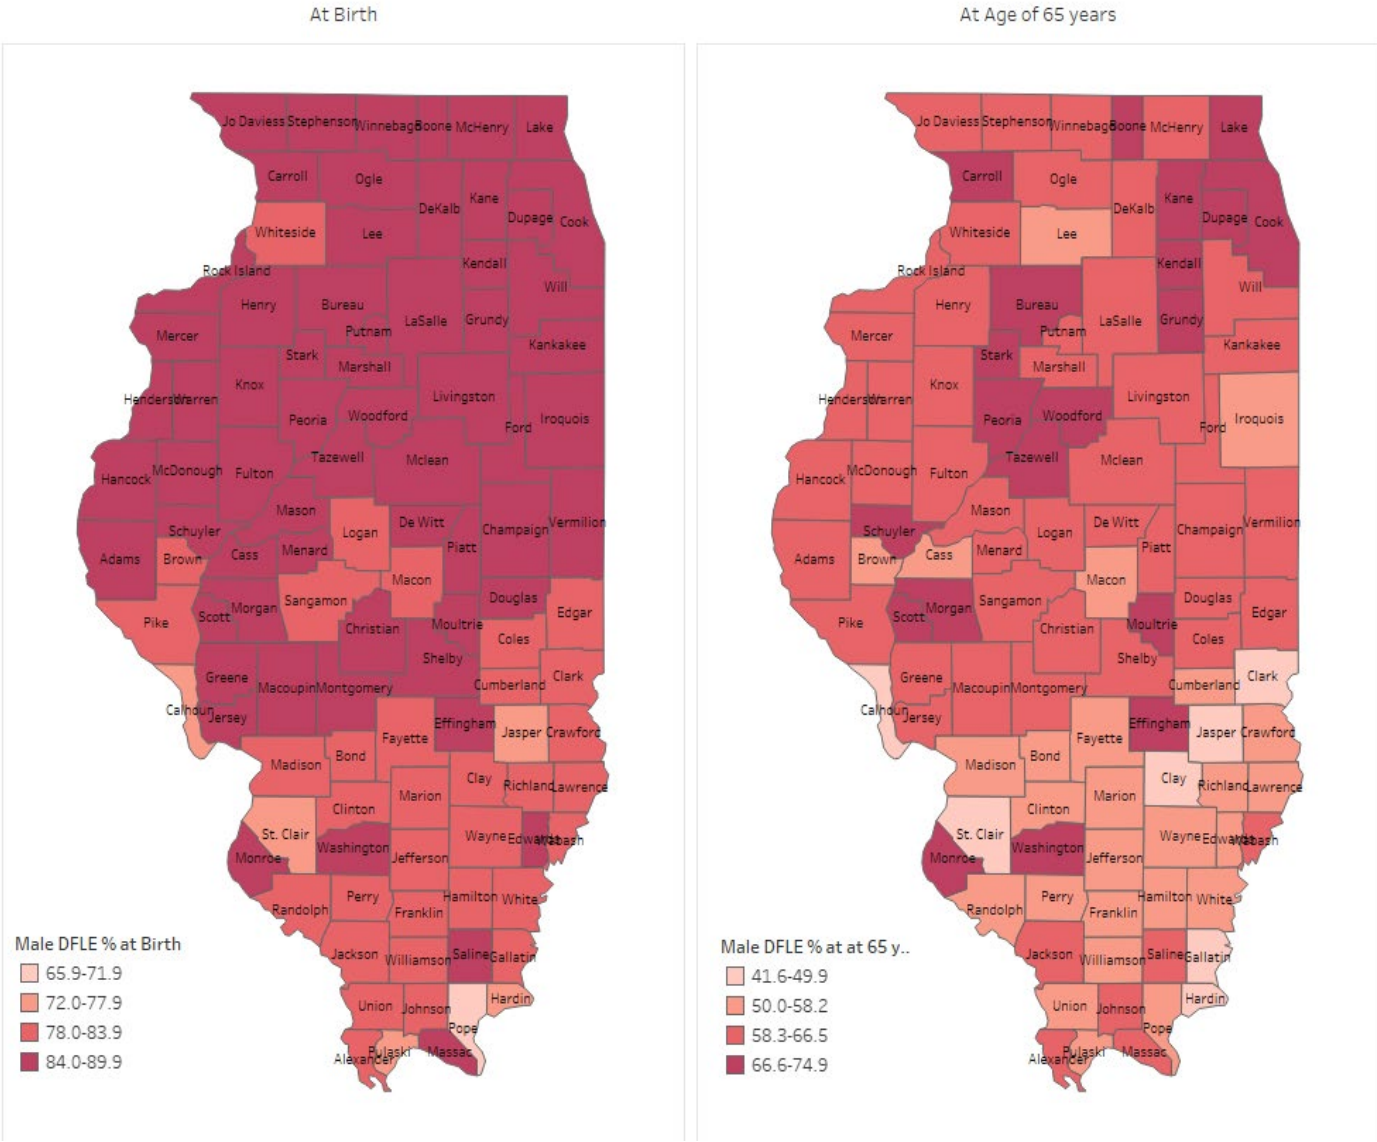

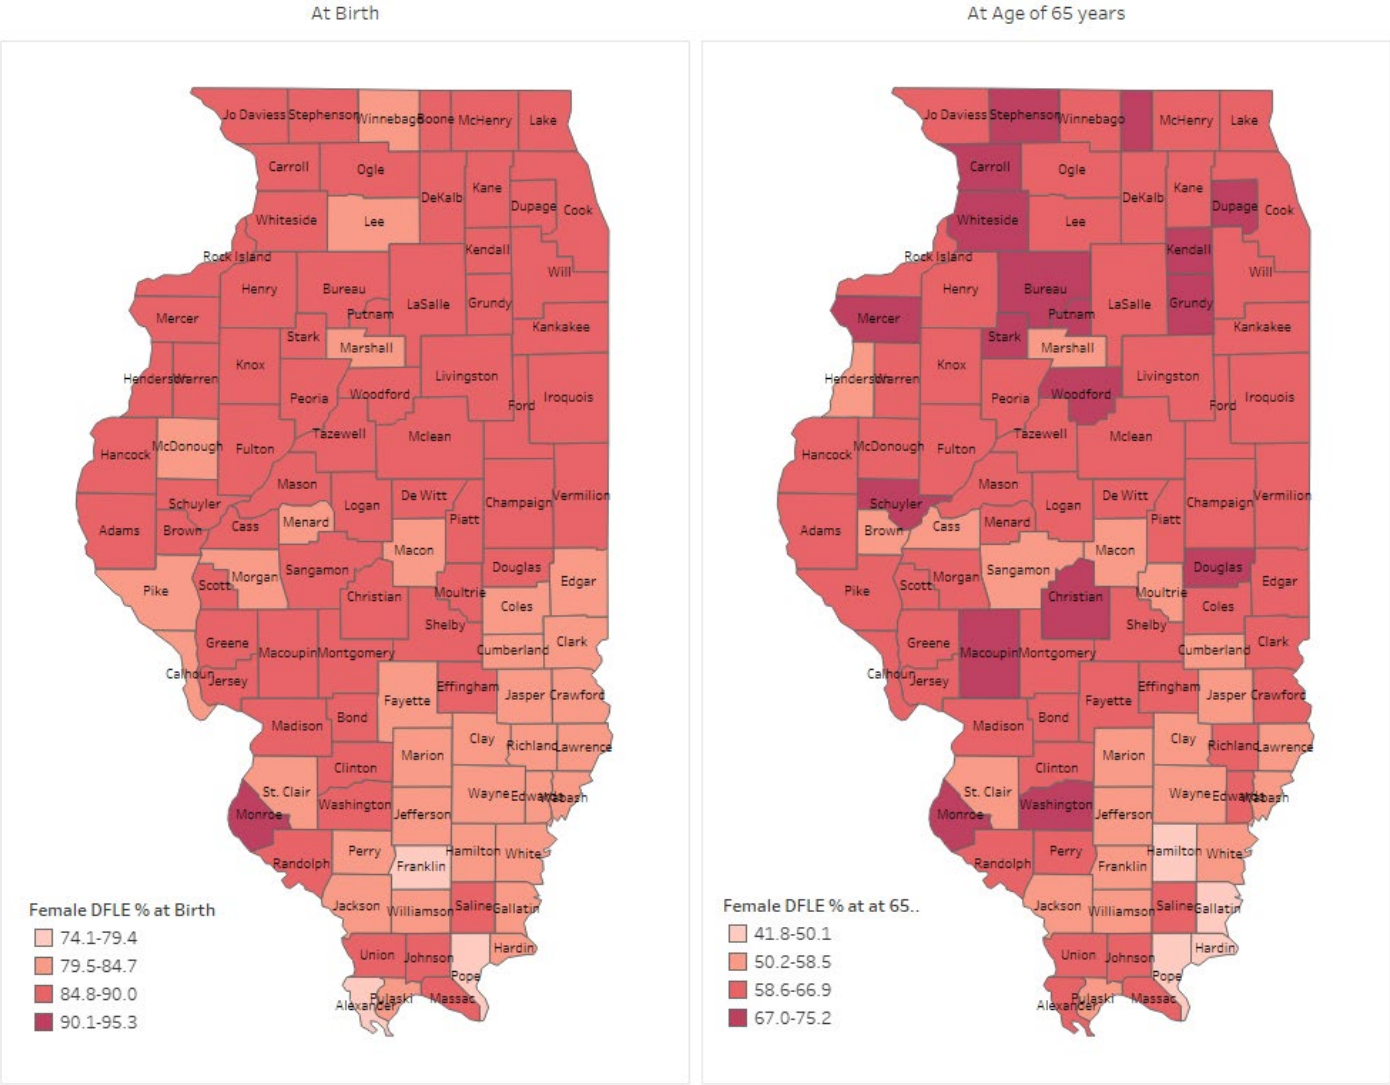

Figure 19 compares the DFLE as a percentage of life expectancy at birth and at age 65 years for females for Illinois counties for 2017-2019. The map on the left side shows the DFLE as a percentage of life expectancy for females at birth. The map on the right side shows the DFLE as a percentage life expectancy for females at age 65 years. Percentages of DFLE at birth range from 74.1 to 95.3 and the percentages of DFLE at age 65 years decrease and range from 41.8 to 75.2.

Figure 19. Disability-Free Life Expectancy (DFLE) as percentage of Life Expectancy at Birth and at Age 65 Years for Females in Illinois Counties, 2017-2019

Mapping of DFLE as a percentage of remaining years of life at birth and at age 65 by county, categorized by quartiles, shows significant contrast between the northern and the southern regions of the state, with most of the north falling in the first quartile and the south laying in the last quartile (Figures 17 to 19).

Discussion and Limitations

This report combines functional disability prevalence rates and functional disability-free life expectancy.

Disability-free life expectancy is a summary measure (an index) used to represent health status in a single number (Molla et al. 2001). This index can be used to measure change over time in the health status of the state and its counties. The following are some of the uses of this summary measure of health (Chang et al 2013):

- Predicting future health service needs
- Evaluating health programs
- Identifying trends and inequalities

Some of the limitations of the report are:

- American Community Survey data are self-reported by the respondents and may be influenced by their demographic and socio-economic characteristics.
- Small numbers and reliability issues.
- Response rates and mode of survey.

The summary index (disability-free life expectancy) is easy to understand and can be used as baseline data. This will help in identifying health disparities by gender and geography.

e_x = life expectancy at age x for all causes.

l_x = Number of alive at age x

L_x = Number of years in interval

π_x = Disability Proportion at age x

$1-\pi_x$ = Disability-free proportion at age x

e'_x = Disability-free life expectancy

Significance level = 0.05 (2-tailed test, $-1.96 < Z < 1.96$)

Table 3: Prevalence of Disability by Age and Sex in Illinois, Chicago and Illinois Counties: 2015 - 2019.

Table 6: Total Life Expectancy (LE) and Disability-Free Life Expectancy (DFLE) by Sex at Ages 0, 35, 65, and 75 Years for Illinois, Chicago and Illinois Counties, 2017-2019 (Continued)

State/Chicago / Counties	Age	Both Sexes (T)			Male (M)			Female (F)			Z-Score of Differences DFLE(F) - DFLE(M)
		LE(T)	DFLE(T)	DFLE(T) as % of LE(T)	LE(M)	DFLE(M)	DFLE(M) as % of LE(M)	LE(F)	DFLE(F)	DFLE(F) as % of LE(F)	
Winnebago	65	19.00(±0.38)	12.29(±0.08)	64.68	17.37(±0.51)	11.53(±0.11)	66.38	20.49(±0.56)	12.97(±0.12)	63.30	17.69*
Winnebago	75+	12.30(±0.38)	6.94(±0.08)	56.42	11.07(±0.50)	6.75(±0.11)	60.98	13.29(±0.55)	7.09(±0.12)	53.35	4.13*
Woodford	0	79.26(±1.61)	68.69(±0.27)	86.66	76.81(±2.39)	68.78(±0.33)	89.55	81.84(±2.10)	72.32(±0.36)	88.37	14.24*
Woodford	35	46.25(±1.23)	38.84(±0.22)	83.98	44.48(±1.76)	37.82(±0.31)	85.03	48.09(±1.69)	39.92(±0.33)	83.01	9.20*
Woodford	65	19.48(±1.00)	13.96(±0.20)	71.66	18.20(±1.47)	13.62(±0.28)	74.84	20.74(±1.36)	14.34(±0.30)	69.14	3.48*
Woodford	75+	12.24(±0.96)	7.63(±0.21)	62.34	11.50(±1.48)	7.74(±0.29)	67.30	12.87(±1.27)	7.55(±0.28)	58.66	-0.92

- Margin of errors are shown in parentheses.
- Because of rounding, components may not add to totals.
- LE = Life expectancy; DFLE = Disability-Free Life Expectancy; T = Both sexes; M= Male; F=Female
- * = significant at 0.050 (Two-tailed tests)
