

Vaccination Equity for Prevention of Monkeypox (mpox)

In the United States the **JYNNEOS vaccine** has FDA approval for the **prevention** of mpox and smallpox. It can be given either via:

Both are equally effective and require getting a shot (usually in the arm). Unvaccinated people have a **14 times higher risk of monkeypox disease** than those who got vaccinated.

Subcutaneous

(under the skin)

Intradermal

(in between layers of the skin)

Note: People with **darker skin** especially **Black, Latino, or Asian** people, and people **ages 20 - 30** are more likely to develop keloid scars as a reaction to skin injury.

If individuals have had keloid scarring in the past or have concern they will have keloid scarring, JYNNEOS can be administered:

Subcutaneously

If you have concerns, you may discuss this with your provider or vaccinator.
